

Plan

Where is your business heading over the next 3-5 years?

Will the technology you have today take you where you plan to be, or will it hold you back?

At Summit Systems we provide strategic IT experience regardless of industry.

We measure our success by helping our clients succeed. We don't believe in delivering "ninja IT support" where technicians arrive and disappear and all you have to show for it is an invoice. We begin our partnership by performing a complete inventory of all aspects of your IT infrastructure and review existing playbooks to identify existing processes that must be maintained and identify gaps that need addressing. From that point forward we work with you to understand your business and deliver the results you are aiming for by meeting with you regularly to ensure that you spend as much time on IT as you would like.

Process - Our systems and processes are in place to ensure repeatable events are completed without issue. Simple things like a new employee should never be something you have to be managing the IT for.

Budget - As businesspeople we understand the need to be on budget. We recommend best of need, not best of breed and design solutions that give you the biggest return on investment.

Growth - We'll assist your business adjusting to changing conditions and ensure that your technology is right sized and scalable for your future needs.

Change Management - We follow strict Change Management so that we understand what technology is added and removed from your organization, that all of it is protected and secure, and that you're not paying for something that you no longer need or use.

Lifecycle planning - During quarterly business reviews we'll share a snapshot of where your technology sits in its overall lifecycle, and work with you to plan for any end-of-life activity that is required.

Next generation technology - We are passionate about technology, and we will keep up to date with new technology that you should be aware of, meaning you don't have to!

Summit Systems specializes in the design, deployment, security, support, and strategic plan of your IT systems.
